Additional exercises

1 Random variable parameter estimation

A discrete random variable X is defined by

$$X = \begin{cases} -20, & prob. = 1/3\\ 30, & prob. = 1/2\\ 10, & prob. = 1/6 \end{cases}$$
 (1)

- (a) find the expected value
- (b) find the variance
- (c) find the mode
- (d) find the coefficient of variation

2 Normal distribution

The annual precipitation at a station has a normal distribution with a mean of 100 cm. What is its standard deviation if the probability is 0.1 that it will take on a value greater than 115 cm?

3 Frequency analysis

- (a) What is the return period? What is Probability of exceedence? What is a design flood?
- (b) Assume the yearly maximum discharge of a river is a random variable X, such that $\ln X$ is normally distributed with a mean of 5, and a standard deviation of 0.5 if X is expressed in m^3/s . ($\ln X$ stands for the natural logarithm). A flood arises when yearly maximum discharge is larger than a critical value q.
 - (i) If the probability that a q is exceeded in one year is 0.75, what is q?
 - (ii) If the probability that a q is not exceeded in one year is 0.5, what is q?
 - (iii) Calculate the non-exceedence probability of the discharge 100 m³/s
 - (iv) If the return period of a flood is 10 years, what is then the probability of at least 1 flood in 10-year

4 Multiple linear regression

What are the assumptions behind multiple linear regressions?

5 Confidence intervals

A sample of 20 random observations produced a mean of 145 and variance of 30.

- (a) What is the 95% confidence interval on the mean assuming a normal distribution if
 - (i) the true variance is unknown and estimated as 30
 - (ii) the true variance is 30
- (b) What is the reason for the difference of results in part (i) and part (ii)?
- (c) What is the 95% confidence interval on the variance?

6 Hypothesis testing

Based on two samples with 10 observations each, the following estimates for mean and standard deviations have been obtained:

$$\mu_1 = 44.1$$

$$\mu_2 = 50.0$$

$$\sigma_1 = 3.3$$

$$\sigma_2 = 5.6$$

- (a) Test if the estimates for mean and standard deviation are significantly different. Use a significance level of 5%.
- (b) We make two types of errors in hypothesis testing.
 - (i) Explain type I and type II errors.
 - (ii) Explain and illustrate graphically the relation between type I and type II errors.

7 Goodness-of-fit testing

In order to calculate the design flood, you need to know which probability distribution fits your data best. Based on a 35-year record of yearly maximum discharge data from a river station, the following statistics are calculated (with n = 35)

Let
$$Y = \ln Q$$
 (natural logarithm)

Average:
$$\bar{Y} = 5.257$$

Standard deviation:
$$S_V = 0.686$$

The 35 years data are classified into 5 classes as given in the table below.

Class	Observed number
$Q \le 100$	5
$100 < Q \le 150$	9
$150 < Q \le 200$	7
$200 < Q \le 300$	6
$Q \ge 300$	8

- (a) Use Chi square method (with significance level of 5%) to test if the data are log-normally distributed
- (b) Could the Kolmogorov-Smirnov test also be used to perform the goodness-of-fit test?

8 Time series analysis

A 7-year time series of annual measurements is given as the sequence:

110, 88, 51, 64, 39, 23, 10

Perform a trend test of your choice to check if the time series contains a trend. Use a significance level of 5%.

9 Time series analysis and stochastic modeling

Answer the following statements with True if it is always true, otherwise with False.

- (a) Most hydrologic processes (time series) are stochastic processes
- (b) Stochastic process (time series) is stationary
- (c) An independent time series is a stationary time series
- (d) An independent stationary time series is purely random
- (e) A Gaussian time series is an independent series
- (f) A Gaussian time series is a stationary time series
- (g) A white noise times series is normally distributed
- (h) If Xt is a log-normally distributed time series, then Xt is symmetric about its mean
- (i) Markov model (i.e. AR(1) model) is used for an independent stationary time series
- (i) Markov model (i.e. AR(1) model) is used for a nonstationary time series

Formulary

Statistics

Sample mean:

$$\hat{\mu} = m_X = \frac{1}{N} \sum_{i=1}^{N} x_i$$

Sample variance:

$$\hat{\sigma}^2 = s_X^2 = \frac{1}{N-1} \sum_{i=1}^{N} (x_i - m_X)^2$$

Sample coefficient of variation:

$$C\hat{V}_X = \frac{s_X}{m_X}$$

Sample covariance:

$$\hat{\rho}_{X,Y} = r_{X,Y} = \frac{\sum_{i=1}^{N} (x_i - m_X) \cdot (y_i - m_Y)}{(N-1) \cdot s_X \cdot s_Y}$$

Cumulative probability function:

$$P_X(x_i) = \Pr\{X \le x_i\} = \sum_{X \le x_i} p_X(x_i)$$

Weibull plotting-position:

$$q = \frac{i}{N+1}$$

Probability theory

The *conditional probability* of *A* to occur, given that *B* occurs

$$P(A \mid B) = P(A \cap B) / P(B)$$

where:

P(A|B) = the (conditional) probability that event A will occur given that event B has occurred already

 $P(A \cap B)$ = the (unconditional) probability that event A and event B occur

The probability that A or B occurs, in case of dependent events:

$$P(A \cup B) = P(A) + P(B) - P(A \cap B)$$

$$P(A \cup B) = P(A) + P(B) - P(A \mid B) \cdot P(B)$$
 if A and B are dependent $P(A \cup B) = P(A) + P(B) - P(A) \cdot P(B)$ if A and B are independent $P(A \cup B) = P(A) + P(B)$ if A and B are mutually exclusive

The probability of both A and B to occur:

$$P(A \cap B) = P(A|B) \cdot P(B)$$
 or $P(A \cap B) = P(B|A) \cdot P(A)$

$$P(A \cap B) = P(A) \cdot P(B)$$
 if A and B are independent

Probability of 'event A does not occur'

$$P(A') = 1-P(A)$$
 probability of A not to occur $P(A \cap A') = 0$ probability of A occur **and** A not occur = 0 $P(A \cup A') = P(A) + P(A') = 1$ probability of A occur **or** A not occur = 1

Sampling and counting

• In Ordered without replacement case, the first item has *n* ways of selection, and second has *n-1* ways, Thus *r* ordered items can be selected from *n* without replacement in:

$$(n)_r = n(n-1)(n-2)...(n-r+1) = n!/(n-r)!$$

(The is called the number of **Permutations** of n items taken r at a time)

• Unordered without replacement case, the number of ways in selecting r items from n items is

$$\binom{n}{r} = \frac{(n)_r}{r!} = \frac{n!}{(n-r)!r!}$$

(Combinations are arrangements of elements without regard to their order or position).

• In unordered with replacement case, the number of ways in selecting r items from n items is

$$\binom{n+r-1}{r} = \frac{(n+r-1)!}{(n-1)!r!}$$

Probability distribution functions

For a continuous random variable X, if the function f(x) satisfies:

a.
$$f(x) >= 0$$
 for all x_i
b. $\int f(x) dx = 1$ for the whole range of x

then f(x) is a probability density function.

Relationship between f(x) and F(x) is

$$F(x) = \int f(x)dx$$
And $f(x) = dF(x)/dx$

Since $F(x) = P(X \le x)$ it follows that

$$\int_{a}^{b} f(x)dx = P(a < X < b) = F(b) - F(a)$$

Chi-Square distribution:

$$\chi_c^2 = \sum_{j=1}^n \frac{(O_j - E_j)^2}{E_j}$$

Hypergeometric distribution: The probability of getting x successes in a sample of size n drawing from population of size N contains k successes is

$$f_{x}(x; N, n, k) = \begin{pmatrix} k & N - k \\ x & n - x \end{pmatrix} \begin{pmatrix} N \\ n \end{pmatrix}$$

$$E(x) = \frac{n \cdot k}{N}$$

$$Var(x) = \frac{n \cdot k(N - k)(N - n)}{N^{2}(N - 1)}$$

Binomial distribution:

$$f_x(x;n,p) = \binom{n}{x} p^x q^{n-x}$$

where x- number of success, n – total number of trials, p – probability of one success, q – probability of one failure

$$E(x) = np$$
$$Var(x) = npq$$

Geometric distribution:

$$f_x(x; p) = pq^{x-1}$$

$$E(x)=1/p$$

$$Var(x)=q/p2$$

Flood and extreme value analysis

Return period:

$$TR_X(x) = \frac{1}{1 - F_X(x)}$$

Gumbel distribution:

$$\Pr\{X \le x\} = F_X(x) = \exp\left[-\exp\left(-\left(\frac{x-\xi}{\alpha}\right)\right)\right]$$

$$\mu_x = \xi + 0.5772\alpha$$
$$\sigma_x^2 = 1.645\alpha^2$$

Usage of the frequency factor, K, for the determination of values with return period, TR:

for the Gumbel distribution:

$$K(10) = 1.30$$

$$K(100) = 3.14$$

$$K(1000) = 5.00$$

Confidence Interval and Hypothesis Testing

Confidence Interval for the mean of a normal distribution with unknown variance (n small):

$$l = \overline{x} - t_{1 - \frac{\alpha}{2}, n - 1} S_{\overline{x}}$$

$$u = \overline{x} + t_{1 - \frac{\alpha}{2}, n - 1} S_{\overline{x}}$$

Confidence Interval for the mean of a normal distribution with known variance (n large):

$$l = \overline{x} - z_{1 - \frac{\alpha}{2}} \sigma_{\overline{x}}$$

$$u = \overline{x} + z_{1 - \frac{\alpha}{2}} \sigma_{\overline{x}}$$

Confidence Interval for the variance of a normal distribution:

$$l = \frac{(n-1)S_x^2}{\chi_{1-\frac{\alpha}{2},n-1}^2} , \qquad u = \frac{(n-1)S_x^2}{\chi_{\frac{\alpha}{2},n-1}^2}$$

Hypothesis test statistics

$$t = \frac{\overline{x} - \mu}{S_{\overline{x}}}$$

 H_o is rejected if $|t| > t_{1-\frac{\alpha}{2},n-1}$

$$z = \frac{\overline{x} - \mu}{\sigma_{\overline{x}}}$$

 H_o is rejected if $|Z| > z_{1-\frac{\alpha}{2}}$

$$F_c = S_1^2 / S_2^2$$

 H_o is rejected if $F_c > F_{1-\alpha,n1-1,n2-1}$

Two sample, two-tail:

$$z = \frac{(\overline{x}_{1} - \overline{x}_{2} - \delta)}{\sqrt{\frac{\sigma_{1}^{2}}{n1} + \frac{\sigma_{2}^{2}}{n2}}}$$

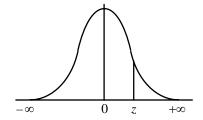

$$H_o$$
 is rejected if $|Z| > z_{1-\frac{\alpha}{2}}$

$$t = \frac{(\overline{x}_{1-} \, \overline{x}_2 - \delta)}{\sqrt{\frac{s_1^2}{n1} + \frac{s_2^2}{n2}}}$$

$$H_o\,is\,rejected\,if\,\,|t|>\frac{w_1t_1+w_2t_2}{w_1+w_2}$$

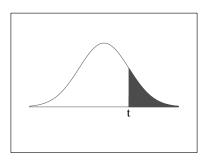

Where,
$$w_1=\frac{s_1^2}{n}$$
, $w_2=\frac{s_2^2}{n}$, $t_1=t_{1-\frac{\alpha}{2},n_1-1}$, $t_2=t_{1-\frac{\alpha}{2},n_2-1}$

F distribution critical value landmarks

Table entries are critical values for F^* with probably p in right tail of the distribution.

Figure of *F* distribution (like in Moore, 2004, p. 656)
